LOW-SIDE SWITCH**33291 (0.6 Ω R_{DS(ON)}) / 33291L (1.2 Ω R_{DS(ON)}) SMART EIGHT OUTPUT
SWITCH WITH SPI INTERFACE**

The 33291 and 33291L are both versatile low-side smart switches incorporating an 8-bit serial shift register to control the 8-bit parallel output latch to provide control of the eight independent output power (ON/OFF) switches. These devices are very useful to drive solenoids, relays, lamps, DC-motors, and other moderate current load (0.5 A) applications.

The 33291 and 33291L interface directly with microcontrollers to control various inductive or incandescent loads. The circuit's innovative monitoring and protection features include very low standby current, SPI cascadable fault reporting, internal 53 V clamp on each output, output specific diagnostics, and independent shutdown of outputs.

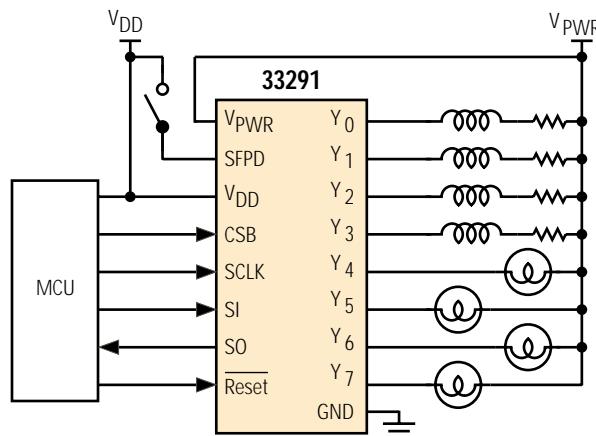

APPLICATIONS

- Aircraft Systems
- Automotive Systems
- Robotics
- Farm Equipment
- Industrial Actuator Controls
- Small DC-Motor Controls
- Marine Systems
- Incandescent Lamp Control
- Applications where low-side switch control with diagnostics is necessary

QUESTIONS

- Do you need to reduce system complexity for switching multiple loads using a microcontroller?
- Do you have very little PC board space available for load control?
- Do you require multiple high-efficiency switches to control capacitive, incandescent, or inductive loads over a wide temperature range?
- Are you looking for an easy-to-design-in solid state switch, capable of switching eight different loads?
- Do you need a "smart" switch with programmable internal protection features as well as fault reporting?
- Do you need multiple switches that can be controlled from a microcontroller via SPI protocol?
