	Load resistor Ω (for optimum performance)	33	
	Weight g	< 2	

Note: Above 85% rh and 40°C a maximum continuous exposure period of 10 days is warranted. Where such exposure occurs the sensor will recover normal electrolyte volumes when allowed to rest at lower %rh and temperature levels for several days.

NOTE: all sensors tested and stored at ambient environments unless otherwise stated. As applications of use are outside our control, the information provided is given without legal responsibility. Customers should test under their own conditions, to ensure that the sensors are suitable for their own requirements.

## NO2-D4 Performance Data

Figure 2 Sensitivity temperature dependence

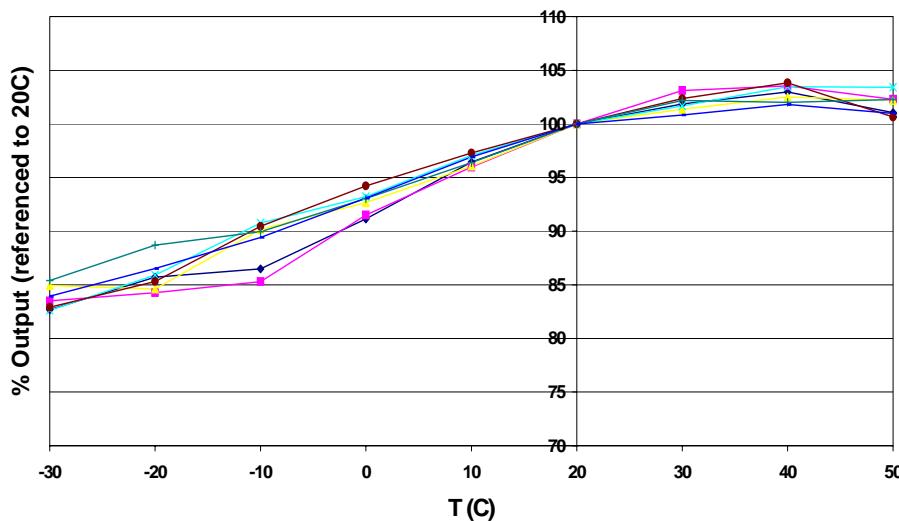

Figure 2 shows the variation in sensitivity caused by changes in temperature.

This data is taken from a typical batch of NO2-D4 sensors. Good repeatability means accurate temperature compensation.

Zero temperature dependence is the same as CL2-D4

Figure 3 Response to 20ppm NO<sub>2</sub>

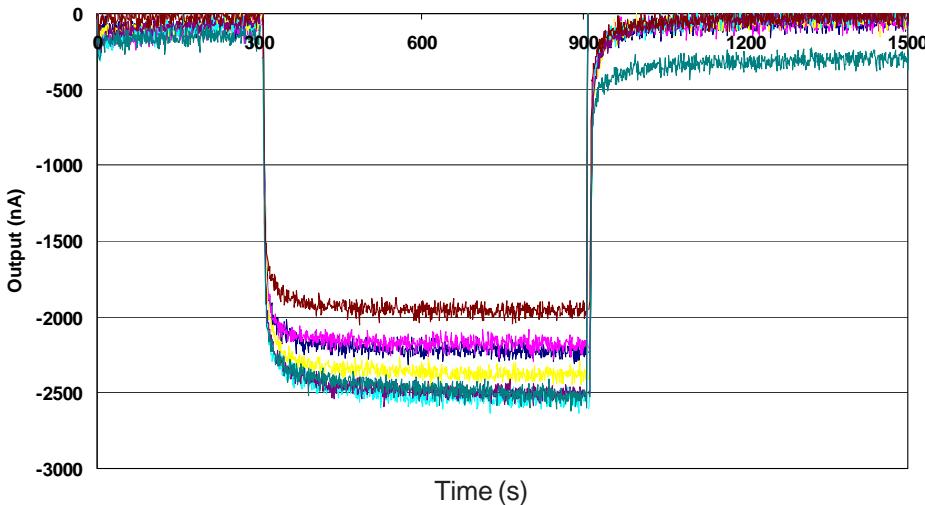

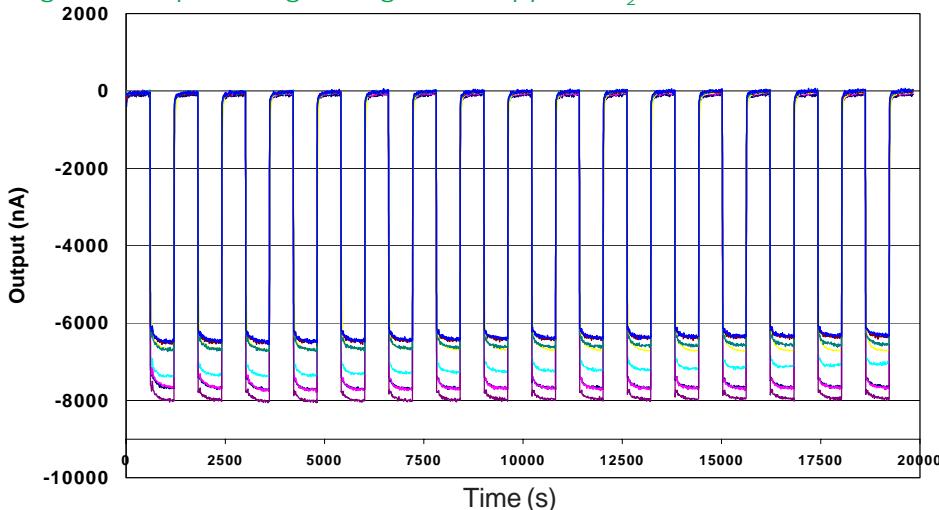

Figure 3 shows response to first zero air, then 20 ppm NO<sub>2</sub> and then zero air.

Fast response time and good zero stability give confidence that the sensor will respond rapidly and reliably to a gas emergency.

Figure 4 Repeated gassing with 20ppm NO<sub>2</sub>

This hysteresis graphs shows stable response with repeated gassing of 20ppm NO<sub>2</sub>
